

## Automatic Dryer Tips and Repairs

- Compactors Vented and Condensing Units
- Stackable Units
- Stacker Units
- Stand Alone Units

It is important to maintain the efficiency of your dryer by cleaning the lint screen before each and every load.

Periodically, check vent piping; also known as the hose, for loose connections and good airflow of the structure. A plastic hose is no longer approved for vent usage and can pose a fire hazard. Do not leave excessive amounts of hose behind machine, as this can lead to restricted air flow. Check the outside of flapper for ventilation and be sure that it is not restricted.

Over time, lint can build up at the rear of the dryer: the solution is to regularly vacuum any excess lint.

If the dryer is making unusual noises, we advise to have the unit serviced as promptly as possible in order to prevent further potential damage from occurring.

It is also recommended that approximately every five years, a dryer be cleaned out in order to remove excessive lint which can potentially catch fire inside the dryer if excessive built-up is left unattended.
